Lead concentration in edible salt of different kinds of vegetables, sea food (anchovies, clams and mussels), a kind of herbs (calamari and others) and table salt, was investigated in the market of Naples. The amount of lead in edible salt of vegetables, sea food and herbs and in table salt was monitored by means of instrumental neutron activation analysis in the LBL unit of INRIM. The results showed that this heavy metal was always found in the utmost concentration in table salt (some cheeses). In general, the quantity of lead was low in the vegetables, both as a whole and in the different categories of products tested, compared with the abundance of this metal in table salt. On the contrary, the concentration of this metal in sea food (including anchovies, clams and mussels) was always significant.Q: Parsing json or retrieving data from a json file without using GSON I've been looking for hours and hours to figure this out but nothing helpful is come up. Using retrofit I have been able to successfully get data from a JSON file and parse it into an activity. I've tried to retrieve the data from a simple array of string using the same retrofit, but I am failing. I would like to know if there's a way to parse this data directly. If I need to use GSON to get it working then please help me with the code.
